

AI-POWERED SMART INFORMATION KIOSK AND DIGITAL SCHOOL MANUAL MANAGEMENT SYSTEM FOR AEMILIANUM COLLEGE INC.

Abstract

The traditional dissemination of school information and student manuals often relies on printed materials and manual announcements, which may limit accessibility, efficiency, and student engagement. To address these challenges, this study proposes the development of an AI-Powered Smart Information Kiosk and Digital School Manual Management System for Aemilianum College Inc.. The system is designed to provide an interactive touchscreen kiosk installed within the school premises, enabling students, faculty, and visitors to conveniently access important school information, policies, announcements, and upcoming events in real time.

The proposed system features a centralized database that stores the digital school manual, allowing users to easily search and browse institutional policies, academic guidelines, and student services through a user-friendly interface. Additionally, administrators are provided with a management portal where they can upload, edit, and delete school announcements, multimedia presentations, and event promotions that are automatically displayed on the kiosk screen. The system also integrates multimedia capabilities, including image and video support, to improve information dissemination and student engagement.

To enhance user interaction and accessibility, the system incorporates an Artificial Intelligence (AI) chatbot capable of answering frequently asked questions related to school policies, enrollment procedures, schedules, and campus services. The AI chatbot utilizes natural language processing to provide instant and accurate responses, reducing the need for manual inquiries and improving communication efficiency within the institution.

The development of this project follows the Agile Software Development methodology to ensure continuous improvement and adaptability throughout the system implementation process. The researchers aim to evaluate the system based on functionality, usability, efficiency, reliability, and user satisfaction. The implementation of the proposed system is expected to modernize information dissemination, improve accessibility to school resources, and promote a more technologically advanced learning environment within Aemilianum College Inc..

Statement of the Problem

Despite the continuous advancement of technology in educational institutions, Aemilianum College Inc. still encounters challenges in disseminating information efficiently to students, faculty, and visitors. The following problems were observed by the researchers:

1. Students experience difficulty accessing updated school manuals, policies, announcements, and other important information due to the limited availability of centralized and digitalized information resources.
2. The current method of posting and managing school events and announcements is time-consuming and less effective, resulting in delayed dissemination of information and reduced student awareness of upcoming activities.

3. The school lacks an automated inquiry assistance system, causing students to rely heavily on manual inquiries to offices and staff for frequently asked questions regarding schedules, procedures, services, and school-related concerns.
